When do Manjaro stable updates come?

Update rhythm, the current pause, and how to measure it yourself

As of 2026-10-22
Branch: stable · this laptop

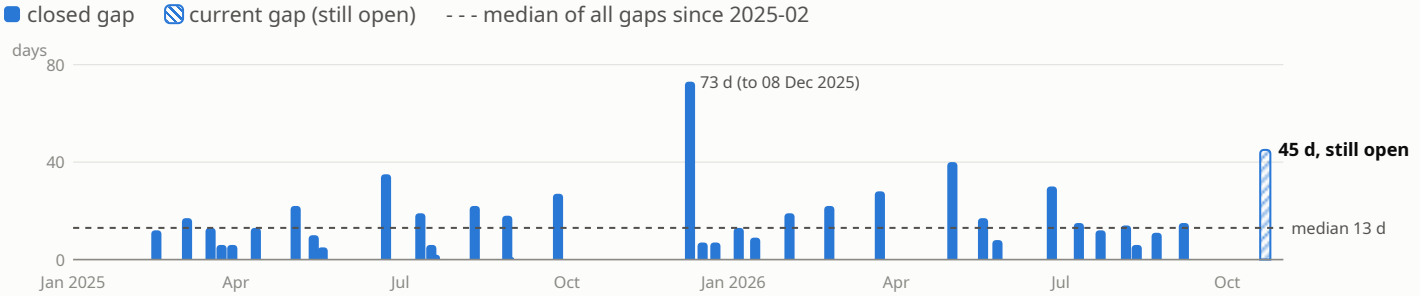

❄ FROZEN
since 2026-09-07: GitLab → Forgejo move. No end date announced.

45 d
since the last stable update (2026-09-07)

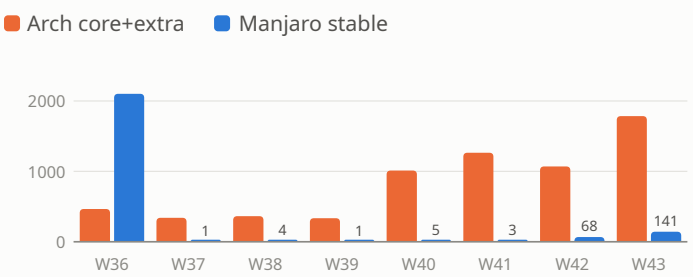

15 d
median gap in 2026 (15 gaps, range 6–40 d)

1 of 35
gaps since 2025-02 were as long or longer. Rare, not a record.

Days between stable updates · one bar per forum announcement, height = days since the previous one

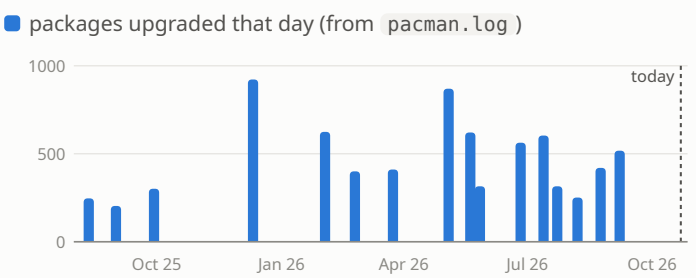

Arch moves, stable does not · packages built per week

The counts include only versions still in the repo, so older weeks look smaller. W36 is the last full stable update.

Update waves on this laptop · days with ≥ 200 upgrades

Waves come every 2–4 weeks. October 2026 has only 12 upgrades so far, mostly Firefox and security packages.

Where the packages wait · version, build age

package	Arch	unstable	testing	stable
linux71	–	–	–	**7.1.13** 48 d
linux72	–	**7.2.12** 1 d	**7.2.9** 19 d	**7.2.3** 48 d
plasma-desktop	**6.8.1** 1 d	**6.8.0** 10 d	**6.7.5** 43 d	**6.7.4** 79 d
mesa	**26.2.5** 7 d	**26.2.5** 7 d	**26.2.4** 20 d	**26.2.2** 49 d
systemd	**262.1** 5 d	**262.1** 4 d	**261.3** 41 d	**261.2** 90 d
firefox	**158.0.1** 2 d	**158.0.1** 2 d	**158.0.1** 2 d	**158.0.1** 2 d

Shaded = older than 30 days. Unstable ≈ Arch, testing ≈ 2–3 weeks behind, stable 6–7 weeks behind. Security fixes (Firefox, CA certificates) still reach stable without an announcement.

Upstream rhythm · what drives the waves

upstream	rhythm	last	next
Linux kernel	9–10 weeks	7.3 · 10-18	7.4 · ~late Dec
KDE Plasma	Feb, Jun, Oct	6.8.0 · 10-14	6.8.3 · 11-03
KDE Gear	Apr, Aug, Dec	26.08 · 08-20	26.12 · Dec
GNOME	Mar, Sep	51 · 09-16	52 · Mar 2027
Mesa	quarterly + 2-weekly fixes	26.2.5 · 10-15	26.2.6 · 10-28
Firefox	4 weeks	158 · Oct	159 · 10-27

The autumn wave (kernel 7.3, Plasma 6.8, GNOME 51, Mesa 26.3) is out. Manjaro stable has none of it yet.

Verdict

- **Yes, stable has slowed down.** The usual rhythm is one update every ~2 weeks, in irregular waves.
- The cause is Manjaro, not Linux or Arch. Arch builds *more* packages than usual right now.
- Reasons given: the Forgejo move, a slow GitLab, and a maintainer with "super limited time".
- Expect a **large** next update: Plasma 6.8 (SDDM → plasma-login-manager), systemd 262, kernel 7.2/7.3.
- **Action:** `linux71` is end of life since 7.1.13. Move to `linux72` or keep `linux618` (LTS).

Measure it yourself

1. Read the stable announcements: `forum.manjaro.org/c/announcements/stable-updates/12.rss`
2. Check the date of the last branch change: `curl -s https://mirror.init7.net/manjaro/stable/state`
3. Compare branch versions: `./measure_branch_lag.sh`
4. Count your own update waves: `./measure_local_waves.sh`
5. Rebuild this page: `python3 make_onepager.py`

The `state` date also changes for small security pushes. It is not proof of a full update.
